                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a His-tagged mutant Tat protein of HIV. The protein is expressed in the yeast Pichia pastoris, and is used to produce the vaccine of the invention. The specification describes the use of HIV THIV NET, OR NET-TAT; and HIV 9D120 in the manufacture of a vaccine. The vaccine is used for the prophylactic or therapeutic immunization of humans against HIV. Tat, Nef or Nef-Tat act in synergy with 9D120 in the treatment and prevention of HIV. The vaccine reduces the HIV viral load in HIV infected humans and results in a maintenance of CD4+ levels over those levels found in the absence of vaccination with HIV Tat, Nef or Nef-Tat and HIV 9p120.
         The present sequence represents a representative HIV-I mutant Nef-His protein. The protein is used in the creation of the fusion proteins of the invention, in conjunction with a fusion partner (e.g. protein D). The specification also describes fusion proteins comprising HIV-I Tat protein. The fusion protein can be used in a vaccine to prevent HIV

```
The present sequence represents a representative HIV-1 mutant Tat-His protein. The protein is used in the creation of the fusion proteins of the invention, in conjunction with a fusion partner (e.g. protein D). The specification also describes fusion proteins comprising HIV-1 Nef protein. The fusion protein can be used in a vaccine to prevent HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 gene; fusion protein; HIV nef gene; Nef protein; Tat protein; HIV infection; protein D.

The present sequence represents a representative HIV-1 Tat-His protein. The protein is used in the creation of the fusion proteins of the invention, in conjunction with a fusion partner (e.g. protein D). The specification also describes fusion proteins comprising HIV-1 Nef protein. The fusion protein can be used in a vaccine to prevent HIV
                                                                               protein; HIV nef gene; Nef protein; Tat protein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 MEPVDPRLEPWKHPGSQPKTACTNCYCKKCCFHCQVCFITAALGISYGRKKRRQRRRPPQ 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a His-tagged mutant His protein of HIV. The protein is expressed in the yeast Pichia pastoris, and is used to produce the vaccine of the invention. The specification describes the use of HIV Tat, HIV Nef, or Nef-Tat; and HIV gpl20 in the manufacture of a vaccine. The vaccine is used for the prophylactic or therapeutic immunization of humans against HIV. Tat, Nef or Nef-Tat act in synergy with gpl20 in the treatment and prevention of HIV. The vaccine reduces the HIV viral load in HIV infected humans and results in a maintenance of CD4+ levels over those levels found in the absence of vaccination with HIV Tat, Nef or Nef-Tat and HIV gpl20.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The present sequence represents a His-tagged Nef-Tat linked protein of HIV. The protein is expressed in the yeast Pichia pastoris, and is used to produce the vaccine of the invention. The specification describes the use of HIV Tat, HIV Nef, or Nef-Tat; and HIV gpl20 in the manufacture of a vaccine. The vaccine is used for the prophylactic or
                                                                                                                                      The present sequence represents a representative HIV-1 Nef-Tat-His protein. The protein is used in the creation of the fusion proteins of the invention, in conjunction with a fusion partner (e.g. protein D). The fusion protein can be used in a vaccine to prevent HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                   EPVDPRLEPWKHPGSQPKTACTNCYCKKCCFHCQVCFITAALGISYGRKKRRQRRRPPQG 61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New use of a human immunodeficiency virus (HIV) Tat, or Nef, or Nef linked to Tat (Nef-Tat) protein or polynucleotide and an HIV gpl20 protein or polynucleotide for the manufacture of a vaccine

                                                                                                                                                                                                                                                                                                                                           The present sequence represents a His-tagged Tat protein of HIV. The protein is expressed in the yeast Pichla pastoris, and is used to produce the vaccine of the invention. The specification describes the use of HIV Tat, HIV Nef, or Nef-Tat; and HIV gpl20 in the manufacture of a vaccine. The vaccine is used for the prophylactic or therapeutle immunication of humans against HIV. Tat. Nef or Nef-Tat act in synergy with gpl20 in the treatment and prevention of HIV. The vaccine reduces the HIV viral load in HIV infected humans and results in a maintenance of CD4+ levels over those levels found in the absence of vaccination with HIV Tat. Nef or Nef-Tat and HIV gpl20.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        nef gene; Nef protein; Tat protein;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents a fusion protein comprising LipoD-HIV-1 Tat-His. The protein is exemplifies the fusion proteins of the invention. The specification also describes fusion proteins comprising HIV-1 Nef protein. The fusion protein can be used in a
  Nef-Tat act
therapeutic immunization of humans against HIV. Tat, Nef or Nef-Tat act in synergy with gpl20 in the treatment and prevention of HIV. The vaccine reduces the HIV viral load in HIV infected humans and results in a maintenance of CD4+ levels over those levels found in the absence of vaccination with HIV Tat, Nef or Nef-Tat and HIV gpl20.

The present sequence represents a His-tagged Nef-Tat linked protein of HIV, with a lipidation signal sequence (Lipob) which is removed after processing and a Proto fusion partner. The protein is expressed in Escherichia coli, and is used to produce the vaccine of the invention. The specification describes the use of HIV Tat, HIV Nef, or Nef-Tat; and HIV ppi20 in the manufacture of a vaccine. The vaccine is used for the prophylactic or therapeutic immunization of humans against HIV. Tat, Nef or Nef-Tat act in synergy with gpl20 in the treatment and prevention of HIV The vaccine reduces the HIV viral load in HIV in the vaccine is a maintenance of CD4+ levels over those levels found in the absence of vaccination with HIV Tat, Nef or Nef-Tat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                  The present sequence represents a fusion protein comprising LipoD-HIV-1 Tat. The protein is exemplifies the fusion proteins of the invention. The specification also describes fusion proteins comprising HIV-1 Nef protein. The fusion protein can be used in a vaccine to prevent HIV infection.

The present sequence represents a His-tagged ProtD-Nef-Tat fusion protein. The protein is expressed in Escherichia coli, and is used to produce the vaccine of the luvention. The specification describes the use of HIV Tat, HIV Nef, or Nef-Tat; and HIV gpl20 in the manufacture of a vaccine. The vaccine is used for the prophylabacisc or therapeutic immunization of humans against HIV. Tat, Nef or Nef-Tat act in synergy with gpl20 in the treatment and prevention of HIV. The vaccine reduces the HIV viral load in HIV infected humans and results in a maintenance of CD4+ levels over those levels found in the absence of vaccination with HIV Tat, Nef or Nef-Tat and HIV gpl20.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents tat protein. The specification describes for the use of biologically active HIV Tat protein, fragments or mutants for the prophylactic or therapeutic treatment of AIDS and tumours, syndromes and symptoms associated with HIV infection. A biologically active Tat protein, fragments and/or mutants and/or Tat DNA which is capable of entering and localizing in the nuclei of activated endothelial cells or dendritic cells and/or activating the proliferation, migration and invasion of Kaposi's sarcoma (KS) cells and cytokine-activated endothelial cells, is used as a vaccine. HIV-1 Tat or its mutants in a bhologically active form is able to induce a very strong immune response against HIV, able to prevent infection or the development of the disease and to permit efficient therapeutic strategies in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 MEPVDPRLEPWKHPGSQPKTACTNCYCKKCCFHCQVCFITAALGISYGRKKRRQRRRPPQ 60

The DNA

æ

```
It is inserted into the genome of vaccinia viruses in a region which is not essential for their propagation to create recombinant vaccinia viruses. These viruses are propagated in animal cells together with recombinant vaccinia viruses which contain DNA coding for a useful protein, for example, human growth hormone, insulin, interferons, interferors amylase, protesse. The presence of tat protein assists the mass-production of the useful protein.
                                                                                                                                                                 ö
All or part of it can be produced by recombinant vaccinia virus by integrating it into the genome region nonessential for vaccinia virus proliferation and then infecting animal cells with the recombinant virus. Tat protein can be used to diagnose HIV infection and for prophylaxis for AIDS or ARC patients. It can also be used to develop a live vaccine using temperature-sensitive Lister strain of vaccinia virus.

TAT is a transactivator involved in the activation of HIV long terminal repeat, acting as an anti-terminator.

NAME OF COLOR OF COLO

```
This sequence represents the HIV transactivating protein, TAT. The sequences given in AAR86601-19 are immunogens derived from the cellular uptake region of this protein. These peptides are based on the region comprising amino acids 46-63. The immunogenic peptides are used to protect against infection by HIV. They may also be used to reduce viraemia in already infected patients. These immunogens may be used to identify, or generate, antibodies specific for TAT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          directed viral gene expression. TAT induced transactivation requires the present of the TAR (transactivation response) element, located at the 5'UTR of the VIRI MRNA element. The sequence of RNA target molecules were chosen based on previous studies characterising the binding properties of the HIV-encoded TAT protein and the TAR target region from both HIV-1 mAINA (nt 1-57). The RNA substrate is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 MEPVDPRLEPWKHPGSQPKTACTNCYCKKCCFHCQVCFITAALGISYGRKKRRQRRRPPQ 60

```
This polypeptide comprises the HIV tat protein. Novel transport proteins comprise modified HIV tat covalently attached to a cargo molecule (see AAW26436.42). The modified tat protein (see AAW26444-49) is characterised by the presence of the tat basic region (thought to be required for nuclear localisation), and the absence of the Cys-rich region and the exon 2-encoded C-terminal region. These modifications solve the potential problems of spurious trans-activation and disulphide aggregation, while the reduced size of the transport proteins minimises interference with the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New DNA constructs for transporting molecules to cells – encode a fusion protein comprising a modified HIV tat protein and a carboxy-terminal cargo molety
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                biological activity of the cargo molecule. DNA molecules that encode the modified tat fusion proteins are claimed and can be used to deliver polypeptides or nucleic acids to the cytoplasm
                                       HIV; tat protein; transport protein; cargo delivery.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Score 478; DB 18;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents the Tat protein from Human Immunodeficiency virus, Type 1 which can be used in a novel method for the delivery of bologically active cargo molecules into the cytoplasm and nuclei of eukaryotic cells. The tat protein from immunodeficiency virus (e.g. HIV-1, HIV-2, SIV) is readily taken up into cells when present extracellularly. By modifying the HIV tat protein i.e. removing the cysteine-rich region and the carboxy-terminal domain and covalently linking the protein to a cargo molecule to form a fusion protein, the problems of spurious trans-activation and disulphide aggregation are radicated. The reduced size of transport polypeptides also minimises interference with the biological activity of the cargo molecule. This is applicable for therapeutic, prophylactic or diagnostic intracellular delivery of small molecules and macromolecules e.g. proteins, nucleic

This sequence represents the human immunodeficiency virus (HIV) Type I active cargo molecules into the cytoplasm and nuclei of cells, for active cargo molecules into the cytoplasm and nuclei of cells, for therapeutic, prophylactic or diagnostic purposes. This is accomplished by the presence of a small basic section of tat transport protein of HIV. This is used as it is this protein which is observed to cause human cells in culture to take up HIV. The method involves the use of a cargo moiety in combination with a transport moiety usually in the form of a culs in culture cargo moiety is a human papillomavirus Ez repressor that retains its biological activity after delivery into a target cell and where the transport moiety is one of following HIV tat protein fragments (a) as 47-58, (b) as 47-62, (c) as 47-62. The protein clay delivery of specific peptides into cells at high concentrations due to use of existing transporters. Previous methods of delivery of include bombardment and transforming, which only allow a fraction of the cell population to be infected and can additionally damage cells as they cause physical opening of the cell walls/membranes to allow entry.
                                                                                                                                                                                             TAT protein; cargo molecule; therapy; diagnosis; transport protein; fusion protein; human papillomavirus E2 repressor; target cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  HIV tat-derived transport fusion proteins - used to deliver blological active molecules e.g. peptide(s) or nucleic acids, specifically into cytoplasm or nuclei of cells
                                                                                                                                                                                                                                                            Human immunodeficiency virus type 1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents Human immunodeficiency virus (HIV) Tat 55. a leaderless protein. A leaderless protein refers to a protein that is found in an extracellular environment, but lacks a canonical leader sequence. The specification describes a method for inhibiting export of a leaderless protein from a cell. The method comprises treating the cell with an agent that inhibits binding between the leaderless protein and a transport molecule. Treatment with the inhibiting agent is specifically used to treat angiogenesis and restenosis, i.e. where expression of FGF-2 is inhibited, and the agent is applied to endothelial or smooth muscle cells. Other applications are treatment of tumours neuroblasstoma), inflammation, cell proliferation, complications of diabetes (e.g. retinopathy), viral, bacterial or fungal infections, polycystic kidney disease and atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Inhibiting export of leaderless protein with agent that inhibits binding to transporter protein - especially for treating angiogenesis and restenois by preventing export of fibroblast growth factor, also methods for identifying leaderless proteins and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Detecting a transport molecule involved in non-endoplasmic reticulum (ER)/Golgi leaderless protein export, comprises contacting test cell extracts or membranes with a fusion protein of a leaderless protein and tags to form a complex of the fusion protein bound to the transport molecule, and detecting the transport molecule in an isolated complex. The leaderless protein is a protein found in the extracellular environment that lacks a canonical leader sequence, interleukin (IL) lapha,or 1-beta, fibroblast growth factor (FGF) io 7, human immondeficiency virus (HIV) tat, platelet-derived endothelial cell growth factor (PD-ECGF), ciliary neutrotrophic factor (CNTF), sciatic nerve growth-promoting activity, vas deferens protein, transglutaminase, L-14 lectin, factor XIIIa, thioredoxin-like protein, transglutaminase. The method is used to detect proteins, complexes of proteins, or parts of a larger complex, that bind to and mediate the transport of leaderless proteins, esponsible for transporting sodium and potassium ions across the cell membrane using ATP as the driving force. Transport molecules detected by the interaction with a larger used in assays to identify inhibitors of the interaction
                                                                                                                                                                                 Human immunodeficiency virus; HIV; Tat 85; transport molecule; golgi; leaderless; endoplasmic reticulum; protein export; detection; inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detecting transport molecules, useful for identifying proteins that mediate leaderless protein export across cell membranes, by contacting cell extracts with a fusion protein of leaderless protein and a tag to form a complex
                                                                                                                                                                                                                                                                                                       /note= "Encoded by AGAA"

The peptides are useful in the detection, prevention and treatment of HIV-1 infections, and in AIDS therapy. The antibodies are especially useful as vaccines for active and passive immunization, or for the detection and/or determination of HIV-1 infected calls and/or HIV-1 viruses. The present sequence represents the amino acid sequence of a tat protein from HIV-1 isolate BHIO (GenBank accession MIS564).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The present sequence represents tat protein. The specification describes the use of biologically active HIV Tat protein, fragments or mutants for the prophylactic or therapeutic treatment of AIDS and tumours, syndromes and symptoms associated with HIV infection. A biologically active Tat protein, fragments and/or mutants and/or Tat DNA which is eapable of entering and localizing in the nuclei of activated endothelial cells or dendritic cells and/or activating the proliferation, migration and invasion of Kaposi's sarcoma (KS) cells and cytokine-activated endothelial cells, is used as a vaccine. HIV-1 Tat or its mutants in a biologically active form is able to induce a very strong immune response against HIV, able to prevent infection or the development of HIV-1-infected individuals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Use of biologically active HIV Tat protein, fragments or mutants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Length 86;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The TAT protein here is encoded by the synthetic tat gene but is identical to the TAT protein found in HIV. The expresson of the TAT protein in transformed yeast enables TAT inhibitory agents to be screened to obtain potential anti-viral agents esp. anti-HIV therapeutic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gene expression system for yeast cells - with TAT protein mediated expression under the control of a HIV regulatory control

present sequence represents tat protein. The specification describes use of biologically active HIV Tat protein, fragments or mutants the prophylactic or therapeutic treatment of AIDS and tumours,
                                                                                                                                                                                  immunodeficiency virus) TAT protein. An antiviral compsn. comprising a first trans-dominant variant (esp. derived from HIV TAT; see ARR77542) of a viral protein and a second trans-dominant variant of a different viral protein of the same virus (esp. derived from HIV REV; see AAR78743 and AAR77543) are used to treat or prevent viral infection, esp. HIV. The trans-dominant variant viral proteins inhibit both infection of cells and viral propagation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                             The invention provides for a method of preparing peptide antagonists of viral transactivating proteins (TAPs) by producing peptide fragments of the TAP and then selecting those which show antagonistic activity.

Alternatively, peptides contg. an active domain of TAP (or the full length protein) are prepd., and one or more AA substn(s). is made to eliminate transactivating activity without destroying binding ability. The antagonists are useful as therapeutic agents in the control of viral infection and viral pathogenicity.

syndromes and symptoms associated with HIV infection. A biologically active Tat protein, fragments and/or mutants and/or Tat DNA which is capable of entering and localizing in the nuclei of activated endothelial cells or dendritic cells and/or activating the proliferation, migration and invasion of Kaposi's sarcoma (KS) cells and cytokine-activated endothelial cells, is used as a vaccine. HIV-1 Tat or its mutants in a biologically active form is able to induce a very strong immune response against HIV, able to prevent infection or the development of the disease and to permit efficient therapeutic strategies in

Sequence 2, Application PC/TUS9506077
GENERAL INFORMATION:
APPLICANT: Immunobiology Research, Institute Inc.
APPLICANT: Immunobiology Research, Extracellular
TITLE OF INVENTION: Vaccine Interdiction of Extracellular
TITLE OF INVENTION: Transactivating Proteins of Human Immunodeficiency Virus
TITLE OF INVENTION: Intercellular Transactivating Strategies
NUMBER OF SEQUENCES: 38
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 1, Application US/08505210

Patent No. 6306613
GENERAL INFORMATION:
APPLICANT: Robert z. Florkiewicz
APPLICANT: Andrew Baird
APPLICANT: Dale E. Warnock
TITLE OF INVENTION: MODULATORS OF LEADERLESS PROTEIN EXPORT
FITLE OF INVENTION: AND METHODS FOR IDENTIFYING AND USING THE SAME
FILE REFERENCE: 200124.402C4
                                                                                          Sequence 17, Application US/09030613
Patent No. 6083706
GENERAL INFORMATION:
APPLICANT: Florklewicz, Robert Z.
APPLICANT: Baird, J. Andrew
TITLE OF INVENTION:
NUMBER OF SEQUENCES: 36
CORRESPONDENCE ADDRESS:
